

LogiVALIDATION

The system for the application of electronic validation to the parking ticket

Advanced technologies for parking automation

In recent years, parking has increasingly been included in contexts such as Hotels and Commercial Galleries, hence the need to facilitate customers who, using the convenience of parking, consumed, bought or used a service of related businesses to the structure.

The solution? Apply a **convention** to the parking ticket, defined by the manager, through a thermal stamping on it.

The use of the "convention stamps" is now superseded by the evolution of technology, which allows the computer to send the code of the discount applied by computer to the system, so that the customer will be recognized as a discount holder, and the amount requested will automatically take into account the discount applied (**electronic convention**).

LOGITAL

Benefits of the "bip"

The new solution has considerable advantages compared to the classic stamp such as: the absence of ordinary maintenance, no risk of incorrect reading or "dirty stamp" and greater speed in the operation.

The centralization with a management software with interface allows not to see the product only as a convention to be applied, but to expand the system to create real commercial and marketing networks being able to reach operators distributed throughout the territory and being able to equip themselves with hardware multi-tasking able to interact with social and users.

We provide different ways to apply conventions: **totems, barcode readers, portable devices ...** **Validation Advanced Interface** is the new intuitive user interface that extends the functions of the product conventions.

Through the various functions available it is possible to:

- View the status (online / offline) of the individual terminal using the traffic light
- View the name and number of the terminal
- Easily change the IP address to make the terminals interchangeable
- Choose the convention for each terminal automatically (multiple conventions with the same device, unlike the old thermal stamp)

Through this interface all standard interventions are eliminated (change of IP address, modification of the agreement that involved the purchase of a new matrix ...) with a **considerable saving of time and cost** during use. An upgrade was brought with the development of the reporting interface, which allows to query the software to get the complete list of conventions applied by period or ticket number, useful for carrying out checks of any kind.

The architecture foresees a central server with the **LogiVALIDATION** application installed, which on one side will communicate in the network with the parking management system and on the other will collect the data of the field devices whether they are connected in **Ethernet, Wifi** or **LoRa**. In fact, depending on the type of customer, the specific reality and the investment budget you can choose between different products each with the same function but with different modes of communication.
